

VioPopUp

Bindings: C, MASM

This call is issued by an application process when it requires a temporary screen to display a momentary message to the user.

VioPopUp (Options, VioHandle)

Options (**PUSHORT**) - input Address of the bit flags that indicate which options to the application are being selected.

Bit	Description
15-2	Reserved, set to zero.
1	0 = Non-transparent operation. The video mode is set to text-mode 3, 3*, 3+, 7, or 7+. The highest resolution supported by the primary display adapter configured in the system is selected. The screen is cleared, and the cursor is positioned in the upper left corner of the display.
1	1 = Transparent operation. If the video mode of the outgoing foreground session is text (mode 2, 3, 7, or one of the * or + variations of these modes), no mode change occurs. The screen is not cleared, and the cursor remains in its current position. If transparent operation is selected, and if the video mode of the outgoing foreground session is not text (or if the outgoing foreground session has a <i>VioSavRedrawWait</i> thread), the pop-up request is refused. A unique error code ERROR_VIO_TRANSPARENT_POPUP is returned in this case.
OS/2 is responsible for saving and restoring the physical display buffer of the previous foreground session around a pop-up. This is true whether transparent or non-transparent operation is selected.	
0	0 = Return with unique error code ERROR_VIO_EXISTING_POPUP if pop-up is not immediately available.
0	1 = Wait if pop-up is not immediately available.

VioHandle (**HVIO**) - input Reserved words of 0s.

rc (**USHORT**) - return Return code descriptions are:

0	NO_ERROR
405	ERROR_VIO_NO_POPUP
406	ERROR_VIO_EXISTING_POPUP
483	ERROR_VIO_TRANSPARENT_POPUP

Remarks

VioPopUp is normally issued by the application when it is running in the background and wishes to immediately display a message to the user without waiting to become the active foreground session.

When an application process issues *VioPopUp*, it should wait for the return from the request. If the process allows any of its threads to write to the screen before *VioPopUp* returns a successful return code, the screen output may be directed to the application's normal video buffer rather than to the pop-up screen. If the process allows any of its threads to issue keyboard or mouse calls before *VioPopUp* returns a successful return code, the input is directed from the application's normal session. Once the process that issued *VioPopUp* receives a successful return code, video and keyboard calls issued by any of the threads in the pop-up process are directed to the pop-up screen. This continues

until the process issues [VioEndPopUp](#). At that time video and keyboard calls resume being directed to the application's normal video buffer.

There may be only one pop-up in existence at any time. If a process requests a pop-up and a pop-up already exists, the process has the choice of waiting for the prior pop-up to complete or receiving an immediate return with an error code. The error code indicates that the operation failed due to an existing pop-up having captured the screen.

Video pop-ups provide a mechanism for a background application to notify the operator of an abnormal event the operator must take some action. When considering the suitability of using pop-ups in a particular situation, the possible disruptive effect of pop-ups to the operator should be considered. If the operator were interrupted frequently by pop-ups issued by background applications, the operator would not effectively work with the foreground application.

While a video pop-up is in the foreground, the operator cannot use the hot key to switch to another application or to the shell . Before the operator can switch another application or the shell to the foreground, the pop-up application must issue [VioEndPopUp](#).

While a video pop-up is in effect, all video calls from the previous foreground session are blocked until the process that issued [VioPopUp](#) issues [VioEndPopUp](#).

When [VioPopUp](#) is issued, only the process within the session that issued [VioPopUp](#) is brought to the foreground. Assuming the session was already the foreground session, any video calls issued by other processes in that session are blocked until the process that issued [VioPopUp](#) issues [VioEndPopUp](#).

[DosExecPgm](#) may not be issued by a process during a pop-up. The following video calls are the only calls that may be issued during the pop-up by the process that issued [VioPopUp](#):

VioEndPopUp	VioScrollLf
VioGetConfig	VioSetCurPos
VioGetCp	VioSetCurType
VioGetFont	VioSetCp
VioGetAnsi	VioSetFont
VioGetState	VioSetState
VioGetCurPos	VioWrtNChar
VioGetCurType	VioWrtNAttr
VioGetMode	VioWrtNCell
VioReadCharStr	VioWrtCharStr
VioReadCellStr	VioWrtCharStrAtt
VioScrollRt	VioWrtCellStr
VioScrollUp	VioWrtTTY
VioScrollDn	

Selectors to the physical display buffer that the issuing process obtained on a prior [VioGetPhysBuf](#) call may not be used during the pop-up.

When an application registers a replacement for [VioPopUp](#) within a session, the registered routine is invoked only when that session is in the foreground. If [VioPopUp](#) is issued when that session is in the background, the OS/2 default routine is invoked. If the application's session is using a keyboard or mouse monitor, the monitor does not intercept data while the pop-up is active.

PM Considerations

This function can be used from within a PM application. Kbdxxx, Mouxxx, and Vioxxxx calls (with a zero handle) are all allowed between [VioPopUp](#) and [VioEndPopUp](#), and are directed to the pop-up screen. An error is returned if issued with a non-zero handle.

C bindings

```
#define INCL_VIO

USHORT rc = VioPopUp(Options, VioHandle);

PUSHORT Options;           /* Option Flags */
Hvio VioHandle;           /* Vio handle */

USHORT rc;                 /* return code */
```

MASM bindings

```
EXTRN VioPopUp:FAR
INCL_VIO EQU 1

PUSH@ WORD Options ;Option Flags
PUSH WORD VioHandle ;Vio handle
CALL VioPopUp

Returns WORD
```
